Half a century ago our knowledge of mycoses, especially pulmonary mycoses, was rather fragmentary. It was limited to rare case reports as oddities. Accordingly, in the "Handbuch der speziellen pathologischen Anatomie und Histologie" the chapter on lung diseases caused by budding and spore-forming fungi by J. WATJEN (Halle) took up as little as 27 pages. Only ARNDT (Göttingen) could report on several cases from which he made his observations on actinomycotic changes of the lungs and pleura. Since then our knowledge of mycoses has deepened and expanded in an unpre dictable manner. This progress was mainly due to research and publications in the USA and South America. In Central Europe the number of cases of mycoses has increased during the last two decades, being reported especially as a second disease in patients with spontaneous or iatrogenic destruction of the bone marrow after treatment of cancer with cytostatic agents. The number of known types of pathogenic fungi has increased. The knowledge of their types and conditions of growth have given rise to a subspecialty. Therefore, a great need has arisen for a new edition of the chapter on mycoses in the Henke Lubarsch-Rossle-Handbook of Special Pathological Anatomy and Histology.

The neuro rehab text that mirrors how you learn and how you practice! Take an evidence-based approach to the neurorehabilitation of adult and pediatric patients across the lifespan that reflects the APTA's patient management model and the WHO's International Classification of Function (ICF). You'll study examination and interventions from the body structure/function impairments and functional activity limitations commonly encountered in patients with neurologic disorders. Then, understanding the disablement process, you'll be able to organize the clinical data that leads to therapeutic interventions for specific impairments that can then be applied as appropriate anytime that impairment is detected, regardless of the medical diagnosis.

The majority of this workbook is composed of full-page color photographs of carefully dissected cadavers, black-and-white line art to color and label, and other activities to guide students through the structures and layers of the human body.
