All of us in biomedicine understand the urgency of getting experimental results into print as quickly as possible. Yet this critical step in the cascade from research conception to publication receives almost no attention in our formal training. It is as if we have been put to sea without a compass. Our collective failure to achieve widespread literacy in our own language — Biomedical Language — seriously impedes the important process of d- seminating new biomedical knowledge and thereby improving the human condition. It is also a significant personal concern for researchers and clinicians in the highly competitive, publish-or-perish environment of c- temporary academia. Of course, if we are clever or lucky enough to come up with that Nobel Prize-winning discovery, great science will carry the day and we are likely to get published even if our writing is fairly horrid. But most of us who publish are “ bread-and-butter ” scientists. We compete for space in journals which may only accept 10% or 20% of the submissions that they receive each year. For us, convincing, engaging writing will make the difference between being published or rejected, or at least it will make the difference between being published on †rst submission or having to go through a number of revisions (or journals). None of this is to propose that good writing can make a silk purse out of a sow ' s ear. Scientist? c content is the sine qua non of biomedical writing.

As the evidence-based medicine movement gathers momentum, it is becoming apparent that valuable information can be derived from individual case studies, provided that the information is structured correctly from the outset. Good clinical reports and case studies must link together several elements of clinical epidemiology, clinimetrics, qualitative research principles and methods for gathering information on individual clinical situations. The first edition of ' Clinical Case Reporting in Evidence-Based Medicine ' was timely in its explanations of the theory and practice of choosing and reporting clinical cases: this new edition provides additional coverage on routine case reports in medicine, surgery and psychiatry, case reporting in occupational medicine and in tort litigation at courts of law. This remains an essentially practical book which is a vital companion to any medical professional contributing to research through individual case reports.
