Hooke's Law and

Spring Constant

Hooke S Law And

Simple

The extension of an elastic object, such as a spring, is described by Hooke's law: force = spring constant \times extension $[F = k \cdot e]$

This is when: force (F) is measured in newtons (N)

Hooke S Law

Hooke's Law implies that in order to deform an elastic object, like a slingshot, a force must be applied to overcome the restoring force exerted by that object.

Hooke S Law

Hooke's law may also be expressed in terms of stress and strain. Hooke's law in simple terms says that strain is directly proportional to stress. Objects that quickly regain their original shape after being deformed by a force, often obey Hooke's law.

Hooke's Law

Hooke's law is a law of physics that states that the force (F) needed to extend or compress a spring by some distance (x) scales linearly with respect to that distance—that is, $F = kx$, where k is a constant factor characteristic of the spring (i.e., its stiffness), and x is small compared to
