Development uses "objects" to  
model real world objects. A car or  
a laptop can be considered as  
object. While traditional  
programming views software as a  
collection of functions, an object  
oriented system concentrates on  
the objects that combines data  
and functionality together.

Object-oriented approaches use the industry standard for modeling object-oriented systems, called the unified modeling language (UML), to break down a system into a use case model. Object-oriented programming differs from traditional procedural programming by examining objects that are part of a system. Each object is a computer representation of some actual thing or event. Objects may be customers, items, orders, and so on. Objects are represented by and grouped into classes that are ...

Object Oriented Development (OOD) has been touted as the next great advance in software engineering. It promises to reduce development time, reduce the time and resources required to maintain existing applications, increase code reuse, and provide a competitive advantage to organizations that use it.

Object-oriented programming (OOP) is a programming paradigm based on the concept of "objects", which can contain data and code: data in the form of fields (often known as attributes or properties), and code, in the form of procedures (often known as methods).. A feature of objects is that an object's own procedures can access and often modify the data fields of itself

object-oriented system, all data is represented as discrete objects with which the user and other objects may interact. Each object contains data as well as information about the executable file needed to interpret that data. An object-oriented system allows the user to focus completely on tasks rather than tools.
